

Operators

Arithmetic follows the usual precedence:

- 11 — times binds tighter than plus
- 14 — parentheses override it
- 3.0 — division always gives a float, even here

Comparisons return a boolean:

- `true`, `true`, `false`

Logical operators combine booleans with words, not symbols:

- `false`, `true`, `false`

And + joins as much as it adds. It glues strings, arrays, and even content:

- Learning
- (1, 2, 3, 4)
- Hello world
