

Symbols and scripts

Greek letters are simply their names: $\alpha, \beta, \gamma, \theta, \pi, \Omega$.

Capitalize the name for the capital letter.

Relations and operators, likewise, by name: $x \leq y, x \geq y, x \neq y, a \times b, a \cdot b, x \in A, A \subset B, x \rightarrow y, n \rightarrow \infty$.

A caret raises a superscript and an underscore lowers a subscript:

$$x^2, \quad x_i, \quad x_i^2$$

Anything longer than a single token goes in parentheses, which group without printing:

$$x^{n+1}, \quad a_{ij}, \quad e^{-\frac{x^2}{2}}$$
