

# Big operators with limits

Write the bounds as an ordinary subscript and superscript. In a block, Typst lifts them above and below the operator:

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}$$

$$\int_a^b f(x) \, dx$$

$$\prod_{k=1}^n k = n!$$

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

Inline, the same operator tucks its bounds to the side to save vertical space, so a sentence stays a sentence: the geometric series  $\sum_{n=0}^{\infty} \frac{1}{2^n} = 2$  converges.
