

Ada Lovelace was born in 1815 and worked in computing. The dot form `ada.field` and the string form `ada.at("field")` fetch the same value: computing.

Keys: name, born, field. Values, as text: Ada Lovelace, 1815, computing. The record has 3 key–value pairs.

Insert a death year, then remove the “field” key
— `.remove` hands back its value (“computing”). The record now holds: name, born, died.

Because assignment copies the value, the original is untouched: “died” in `ada` is **false**.
